Silver Edit: Trajectory-Coordinate Editing for Training-Free 3D Local Editing
Xinxing Wang, Keyu Zhu, Haichuan Song

Research Experience

Silver Edit: Training-Free 3D Local Editing |Graduate research project Mar. 2026–Jun. 2026

Proposed a trajectory-coordinate formulation for training-free 3D local editing, treating local edits as controlled construction of an edited generation trajectory.

- Defined the Trajectory Coordinate View to analyze how guidance context, sampling context, and trajectory interventions affect the edited asset.
- Instantiated this view with Silver Edit, a simple intervention that applies a FlowEdit-style edit vector at selected source trajectory coordinates and constructs the edited trajectory through target-guided sampling.
- Built a unified 3D local editing protocol with a curated 90-case evaluation suite and 16-view geometry-rendering setup; used DINOv3 and Chamfer Distance to measure the edit-preservation trade-off.
- Completed the research loop from problem formulation and method design to experiments, paper writing, supplementary materials, and presentation video preparation.

Additional Research and Engineering Experience

Jewelry 3D Generation Fine-tuning |3D generation project Nov. 2025–Jan. 2026

Explored domain adaptation for jewelry-oriented 3D generation with a small-scale dataset, using data augmentation to expand the effective training set.

- Tested Step1X-3D, TRELLIS, and Hunyuan3D 2.1; compared full fine-tuning and LoRA fine-tuning in terms of training stability, convergence behavior, and output quality.
- Built a data preparation workflow with multi-view renderings and texture-aware inputs to improve coverage under limited data.
- Analyzed failure cases and model limitations for jewelry-specific 3D generation.

Shanghai Linjing Technology Co., Ltd. |Algorithm Engineer Intern Jan. 2025–Oct. 2025

Developed a basketball tactic information extraction system for NBA game videos, building an end-to-end pipeline for player detection, tracking, ReID, team identification, jersey-number recognition, and action recognition to extract structured player information for downstream tactical analysis.

- Trained and tuned a YOLO11m-based player detector with SportsMOT and internal datasets, reaching 0.9989 recall.
- Fine-tuned CLIP ViT-L/14 for ReID contrastive learning and built the tracking-matching module, reaching 0.9986 accuracy.
- Designed a feature adapter on top of ReID embeddings and used prompt-engineered jersey-color descriptions with KMeans clustering for team identification, reaching 0.9960 accuracy.
- Built a multimodal-LLM-based automatic annotation framework for jersey-number data to address the mismatch between open-source recognition methods and deployment scenarios; iteratively trained on the auto-labeled data, reaching 0.9997 accuracy.
- Trained InternVideo2-1B for action recognition by unifying SpaceJam, MultiSports, SportsHHI, and internal data formats; explored sliding-window lengths and crop strategies to improve recognition in deployment scenarios.

Technical Skills

- **Programming:** Python, C++17/20, STL, CMake, Git/GitHub, Docker.
- **ML/CV:** PyTorch, diffusion/DiT models, computer vision, video understanding.
- **3D/Geometry:** 3D generation/editing, asset processing, mesh processing, OpenCV, OpenGL.
